the tri services jtagg ii engine uses two identical brush seals in tandem located aft of the high pressure compressor the engine operating conditions at intermediate rated power irp for this seal are estimated to be 50 000 rpm 899 ft sec speed 175 psid air to air pressure differential and 1200 deg f air temperature the testing was comprised of static air leakage performance seal offset rotor run out tests and a 50 hr endurance test in the nasa lewis seal rig based on the test results it is concluded that the brush seal design should be able to meet the air leakage flow factor goal of less than 0 004 for the engine irp operating conditions as a comparison a labyrinth seal in this location with a 0 005 in typical radial clearance has an estimated leakage flow factor of 0 007 the long term seal life can not be predicted accurately due to the limited endurance testing of 50 hr however based on the excellent condition of the test seal and rotor after 50 hr of testing it is anticipated that the seals should easily meet the jtagg ii engine test requirement

this book combines the essential components of braja das market leading texts principles of geotechnical engineering and principles of foundation engineering it includes the fundamental concepts of soil mechanics as well as foundation engineering including bearing capacity and settlement of shallow foundations spread footings and mats retaining walls raced cuts piles and drilled shafts intended as an introductory text the book stresses the fundamental principles without becoming cluttered with excessive details and alternatives while featuring a wealth of worked out examples and figures that help students with theory and problem solving skills das maintains the careful balance of current research and practical field applications that has made his books the leaders in the fields

this report describes test results from a full scale embankment pilot study conducted in iowa the intent of the pilot project was to field test and refine the proposed soil classification system and construction specifications developed in phase ii of this research and to evaluate the feasibility of implementing a contractor quality control qc and iowa dot quality assurance qa program for earthwork grading in the future one of the primary questions for phase iii is was embankment quality improved the project involved a quality conscious contractor well qualified and experienced iowa department of transportation field personnel a good qc consultant technician and some of our best soils in the state if the answer

to the above question is yes for this project it would unquestionably be yes for other projects as well the answer is yes the quality was improved even for this project as evidenced by dynamic cone penetrometer test data and the amount of disking required to reduce the moisture content to within acceptable control limits approximately 29 of soils by volume required disking perhaps as important is that we know what quality we have increased qc qa field testing however increases construction costs as expected the quality management earthwork program resulted in an additional 0 03 per cubic meter or 1 6 of the total construction costs disking added about 0 04 per cubic meter or 1 7 to the total project costs in our opinion this is a nominal cost increase to improve quality it is envisioned that future contractor innovations have the potential for negating this increase the phase iii results show that the new soil classification system and the proposed field test methods worked well during the iowa department of transportation soils design phase and during the construction phase recommendations are provided for future implementation of the results of this study by city county and state agencies
