this edition contains rewritten chapters throughout with expanded coverage of symmetry and group theory and related areas such as spectroscopy and crystallography reorganized chapters on bonding coordination chemistry and organometallic chemistry are also included

this is the only text currently available organized by class of compound and by property or reaction type not group by group or element by element which requires students to memorize isolated facts this is the only text currently available organized by class of compound and by property or reaction type not group by group or element by element which requires students to memorize isolated facts translated into italian

our objective in compiling a series of chapters on the chemical ecology of insects has been to delineate the major concepts of this discipline the fine line between presenting a few topics in great detail or many topics in veneer has been carefully drawn such that the book contains sufficient diversity to cover the field and a few topics in some depth after the reader has penetrated the crust of what has been learned about chemical ecology of insects the deficiencies in our understanding of this field should become evident these deficiencies to which no chapter topic is immune indicate the youthful state of chemical ecology and the need for further investigations especially those with potential for integrating elements that are presently isolated from each other at the outset of this volume it becomes evident that although we are beginning to decipher how receptor cells work virtually nothing is known of how sensory information is coded to become relevant to the insect and to control the behavior of the insect this problem is exacerbated by the state of our knowledge of how chemicals are distributed in nature especially in complex habitats and finally we have been unable to understand the significance of orientation pathways of insects in part because of the two previous problems orientation seems to depend on patterns of distribution of chemicals the coding of these patterns by the central nervous system and the generation of motor output based on the resulting motor commands

climate change is undisputed but how do we deal with carbon dioxide which is considered the scapegoat for global warming this book offers a critical look at co<sub>2</sub> and its role in the current climate debate it sheds light on the influence of agriculture and forestry the importance of tree species selection in afforestation the challenges of using biogas and hydrogen and questions the role of fossil fuels you will learn how forest fires and land use affect the climate and which methods can actually help reduce co<sub>2</sub> it also shows why co<sub>2</sub> should be seen not only as an environmental problem but also as an essential component for life on earth a guide for anyone who wants to understand the complex relationship between co<sub>2</sub> and our planet
